Serial scaling: runtime and iteration count

Vanda | audited CPU measurements | 3 independent runs per configuration

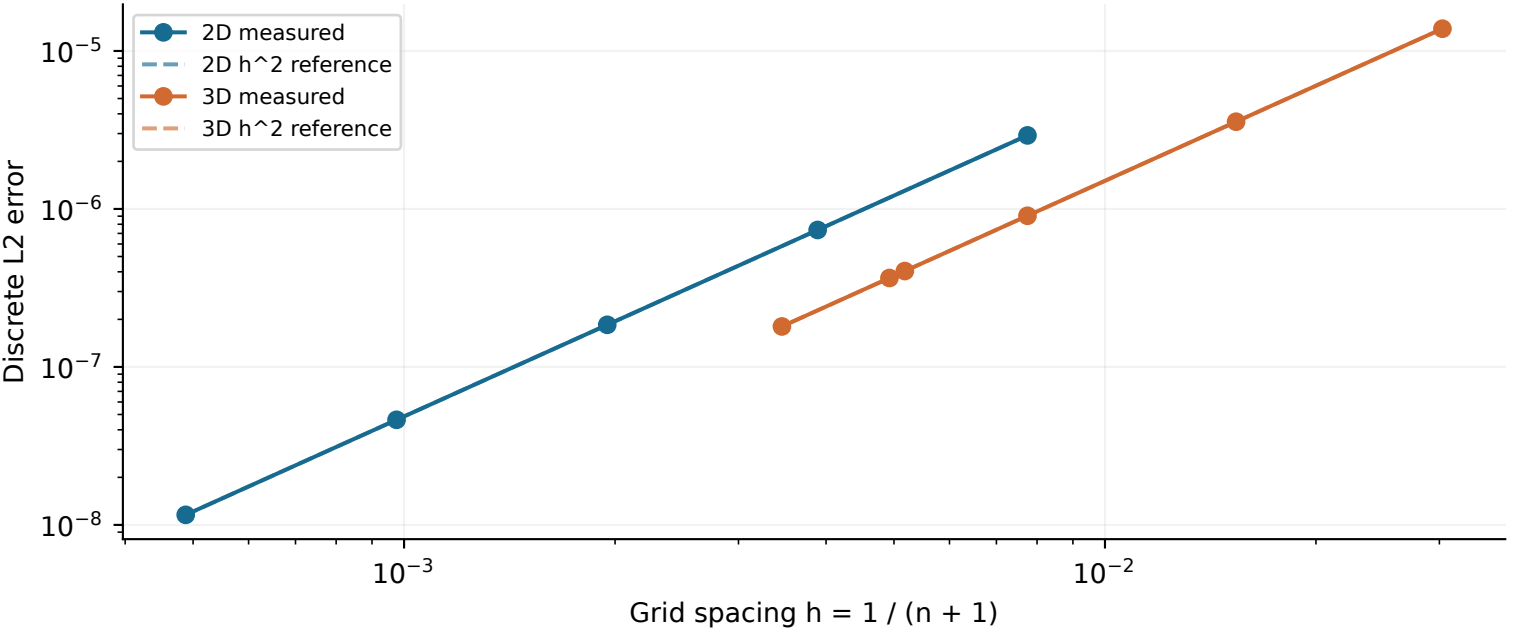

Line/filled marker: minimum; hollow diamond: median; shading: observed min-max (3 runs, not a CI).
All serial sweep meshes retained, including the unused n=202 reference.

Validation: serial discretization error

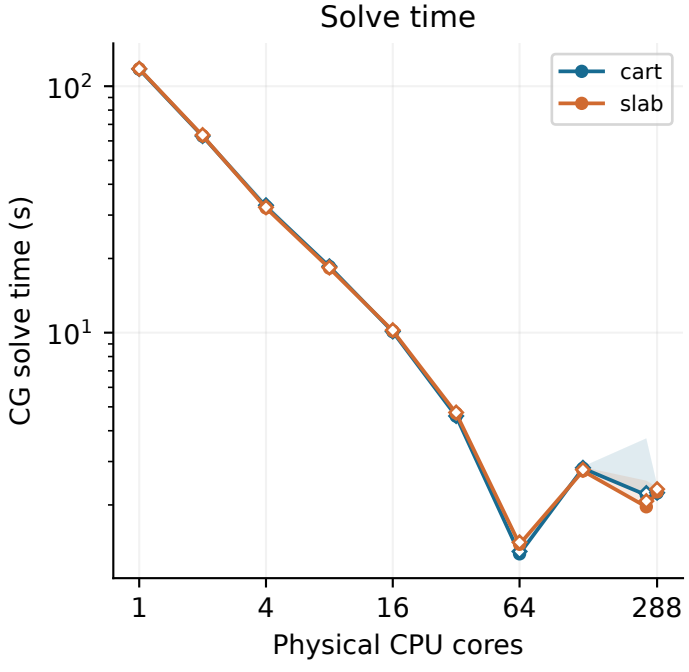

Vanda | audited CPU measurements | 3 independent runs per configuration

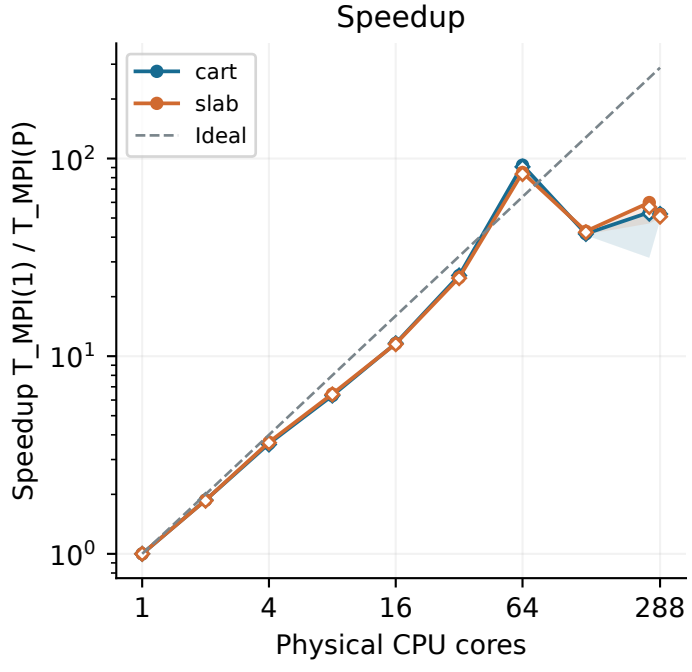

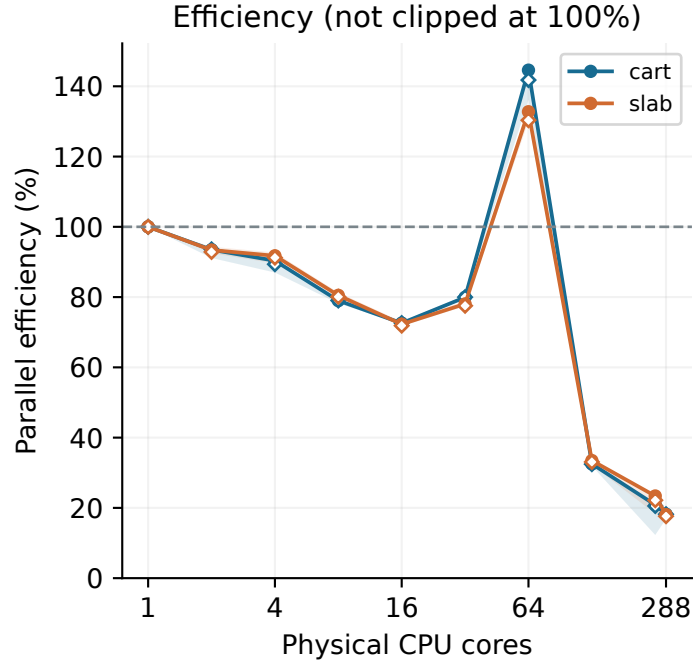

Dashed lines show h^2 trends anchored at each dimension's coarsest mesh; they are not fitted models.
Every retained parallel sample also passes the same-mesh serial iteration/error check and true residual < 1e-8.

2D strong scaling | n=2048 | through 288 physical cores

Vanda | audited CPU measurements | 3 independent runs per configuration

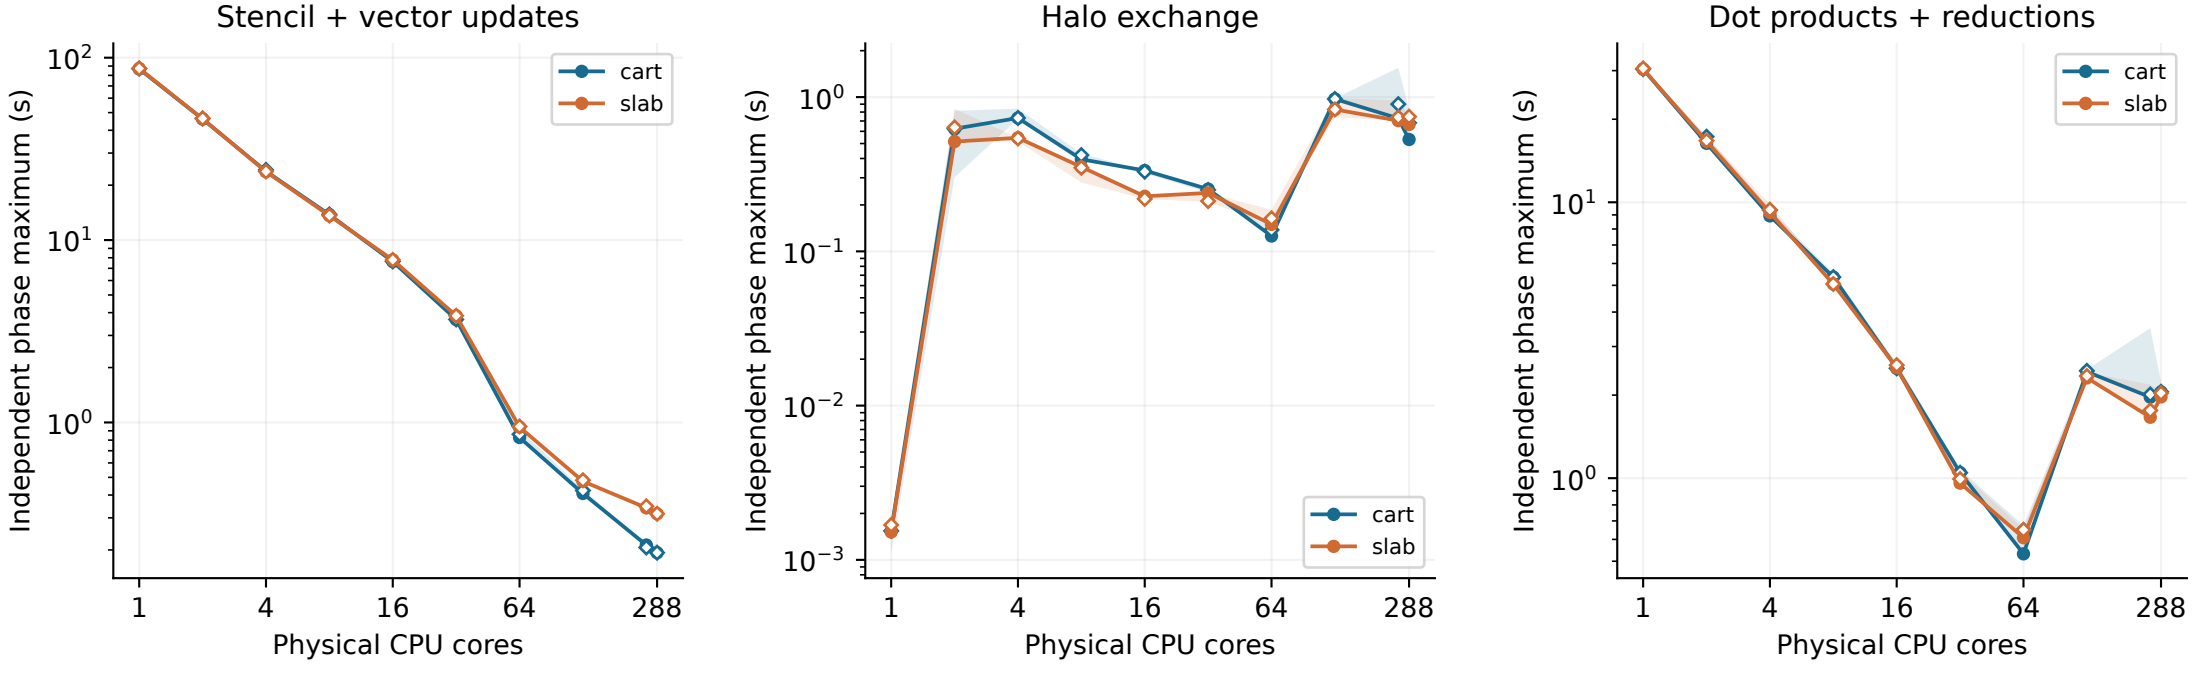

Line/filled marker: minimum; hollow diamond: median; shading: observed min-max (3 runs, not a CI).
Each decomposition uses its own one-rank MPI baseline; ratio shading is an all-pairs range envelope.

2D phase timing | n=2048 | independent rank maxima

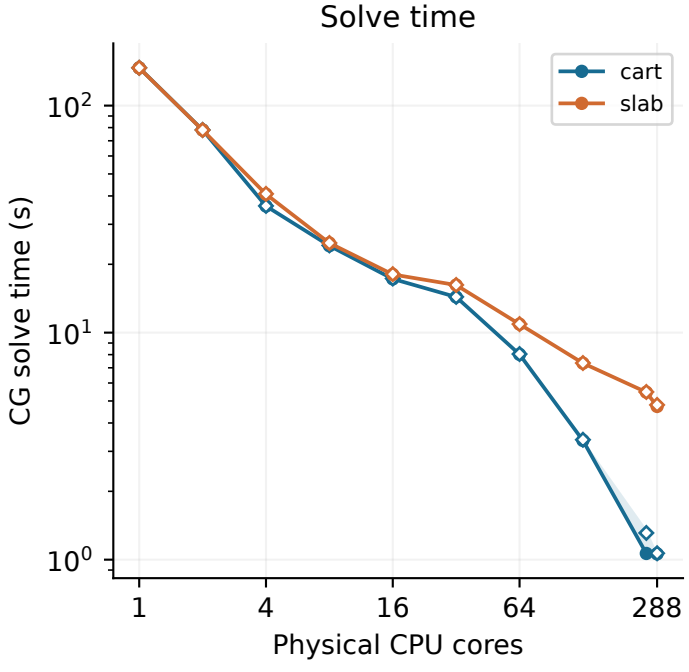

Vanda | audited CPU measurements | 3 independent runs per configuration

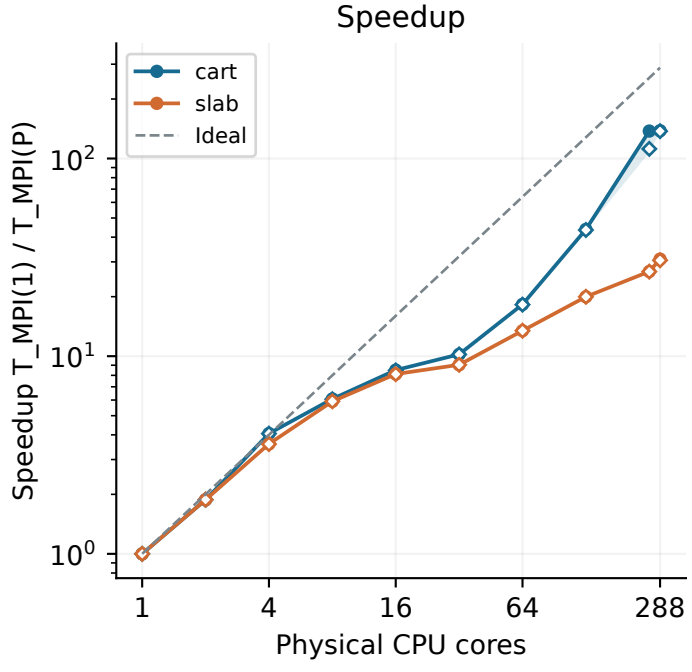

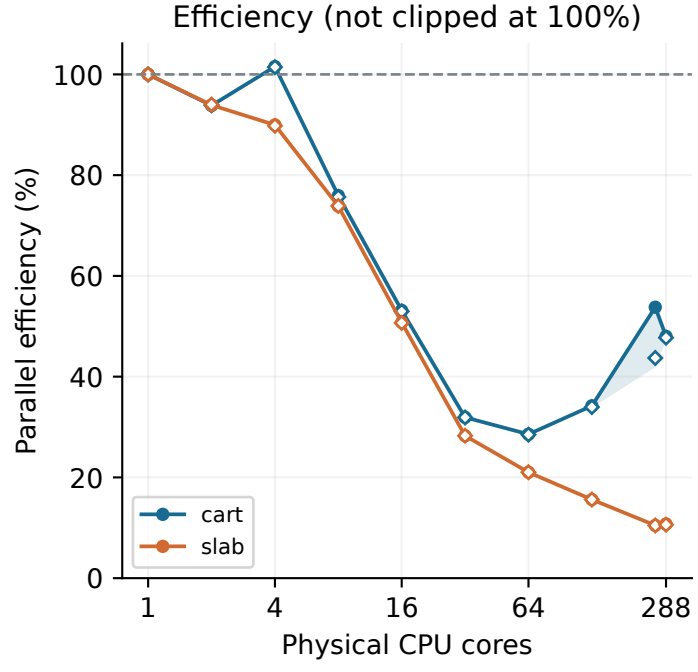

Line: phase from the fastest whole solve; hollow: phase median; shading: observed phase range.
Phase maxima may occur on different ranks and intervals may overlap. Do not stack or interpret their sum as total.

3D strong scaling | n=288 | through 288 physical cores

Vanda | audited CPU measurements | 3 independent runs per configuration

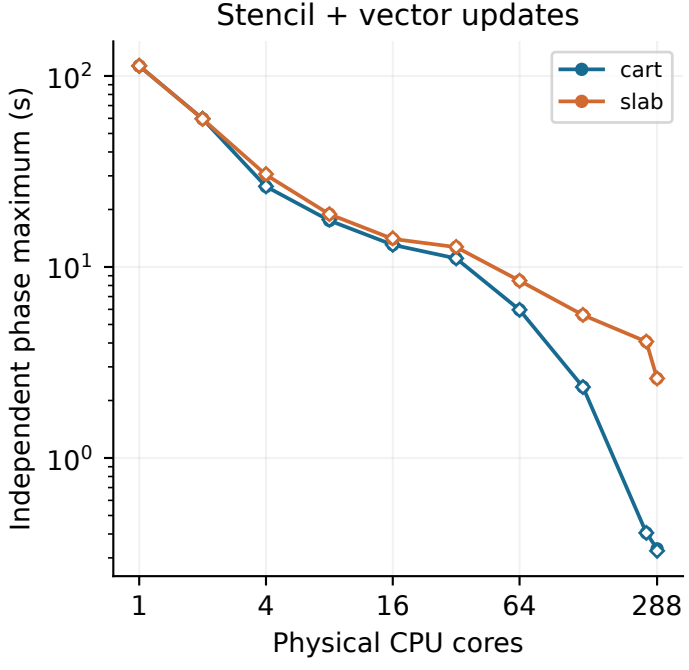

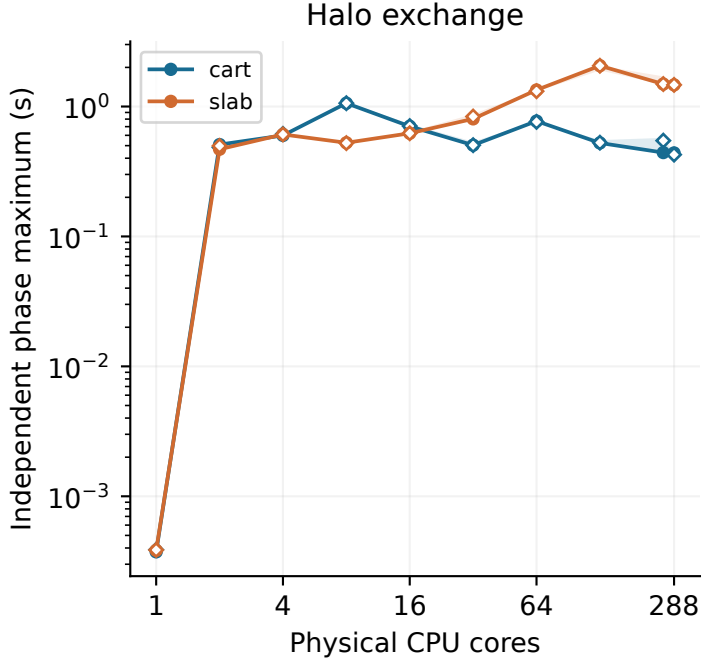

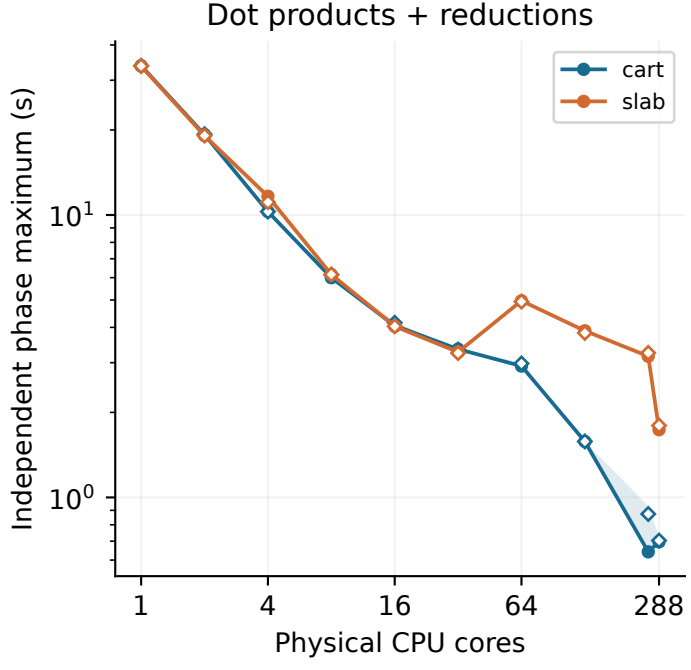

Line/filled marker: minimum; hollow diamond: median; shading: observed min-max (3 runs, not a CI).
Each decomposition uses its own one-rank MPI baseline; ratio shading is an all-pairs range envelope.

3D phase timing | n=288 | independent rank maxima

Vanda | audited CPU measurements | 3 independent runs per configuration

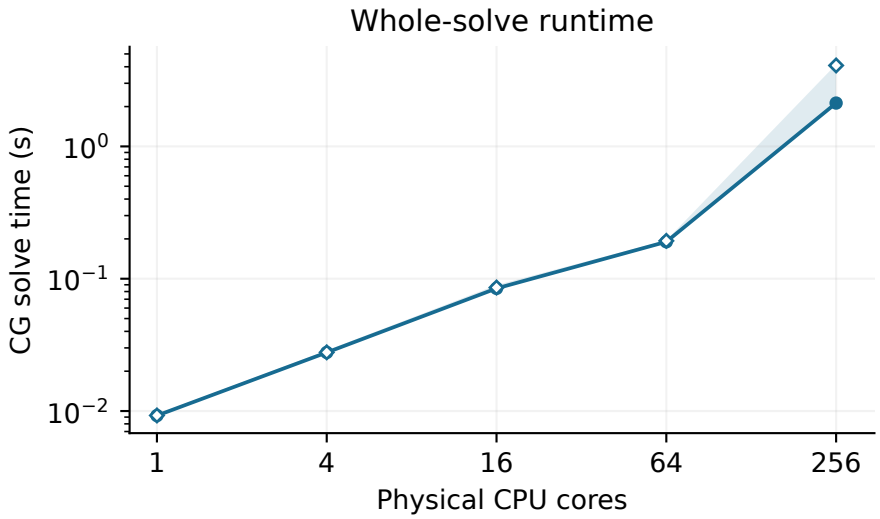

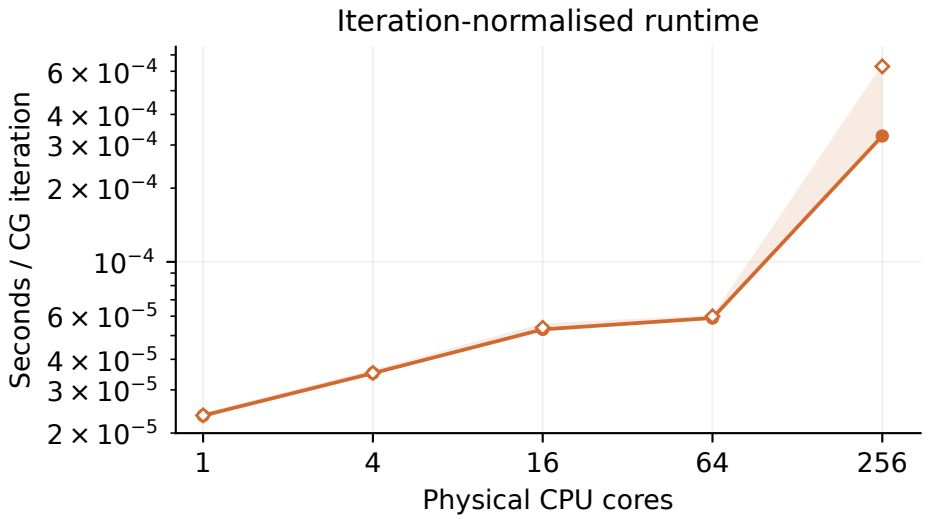

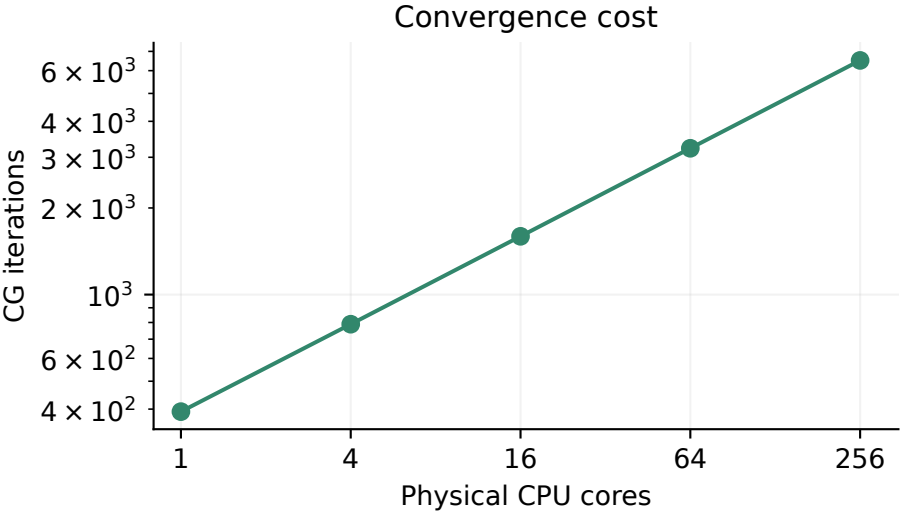

Line: phase from the fastest whole solve; hollow: phase median; shading: observed phase range.
Phase maxima may occur on different ranks and intervals may overlap. Do not stack or interpret their sum as total.

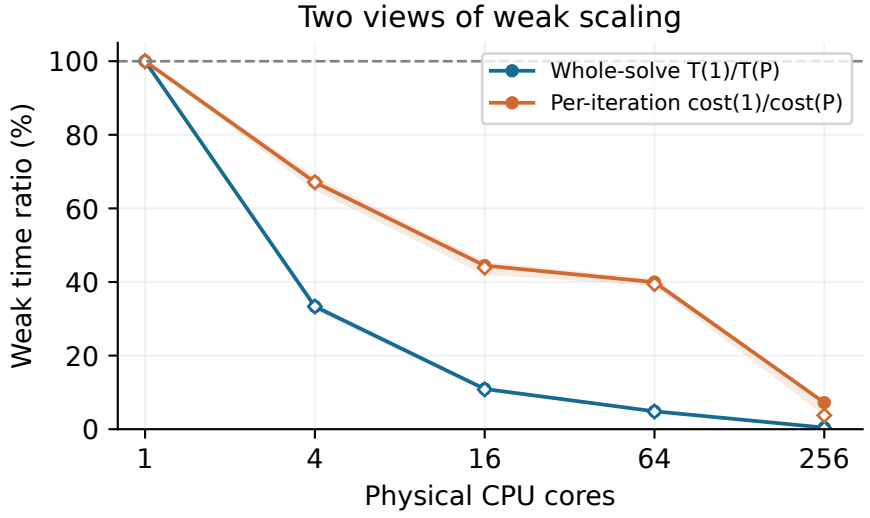

2D weak scaling | through 256 physical cores

Vanda | audited CPU measurements | 3 independent runs per configuration

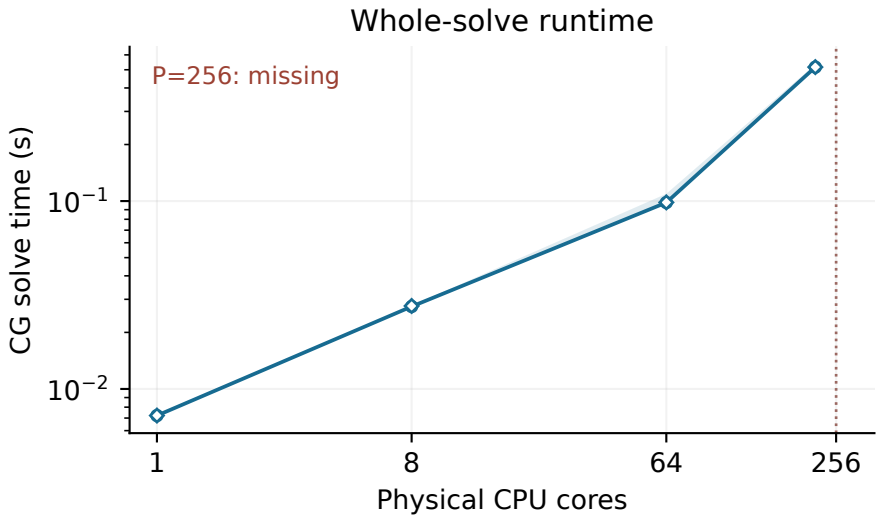

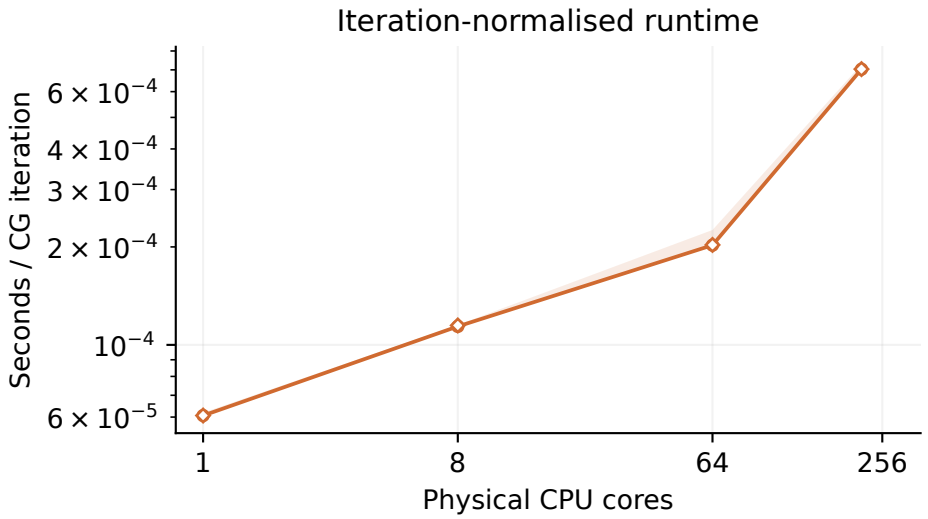

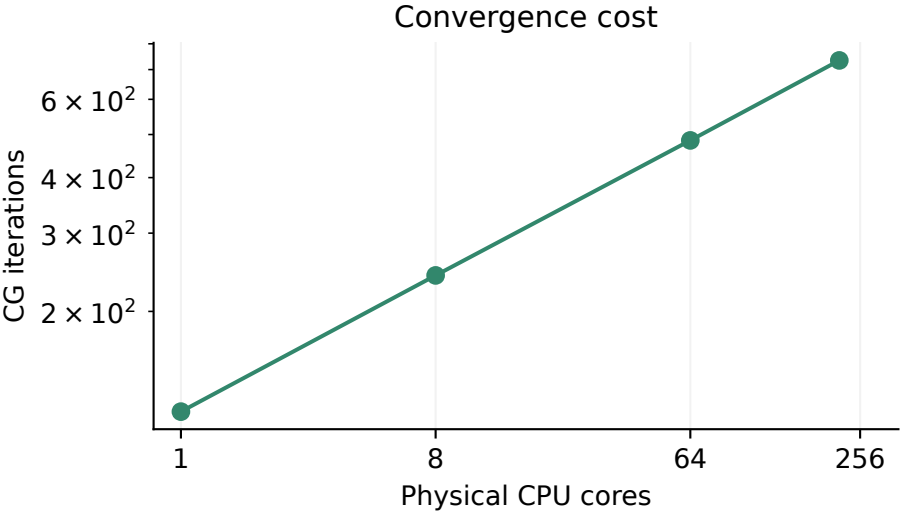

Line/filled marker: minimum; hollow diamond: median; shading: observed min-max (3 runs, not a CI).
2D owned points/core are exactly constant at 16384 through 256 cores.
Whole-solve time includes iteration growth; per-iteration ratios isolate average iteration cost.

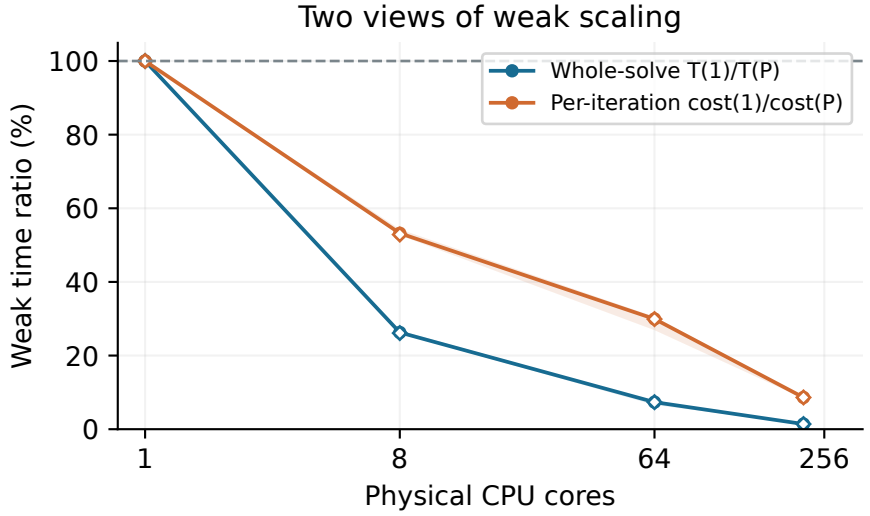

3D weak scaling | incomplete endpoint

Vanda | audited CPU measurements | 3 independent runs per configuration

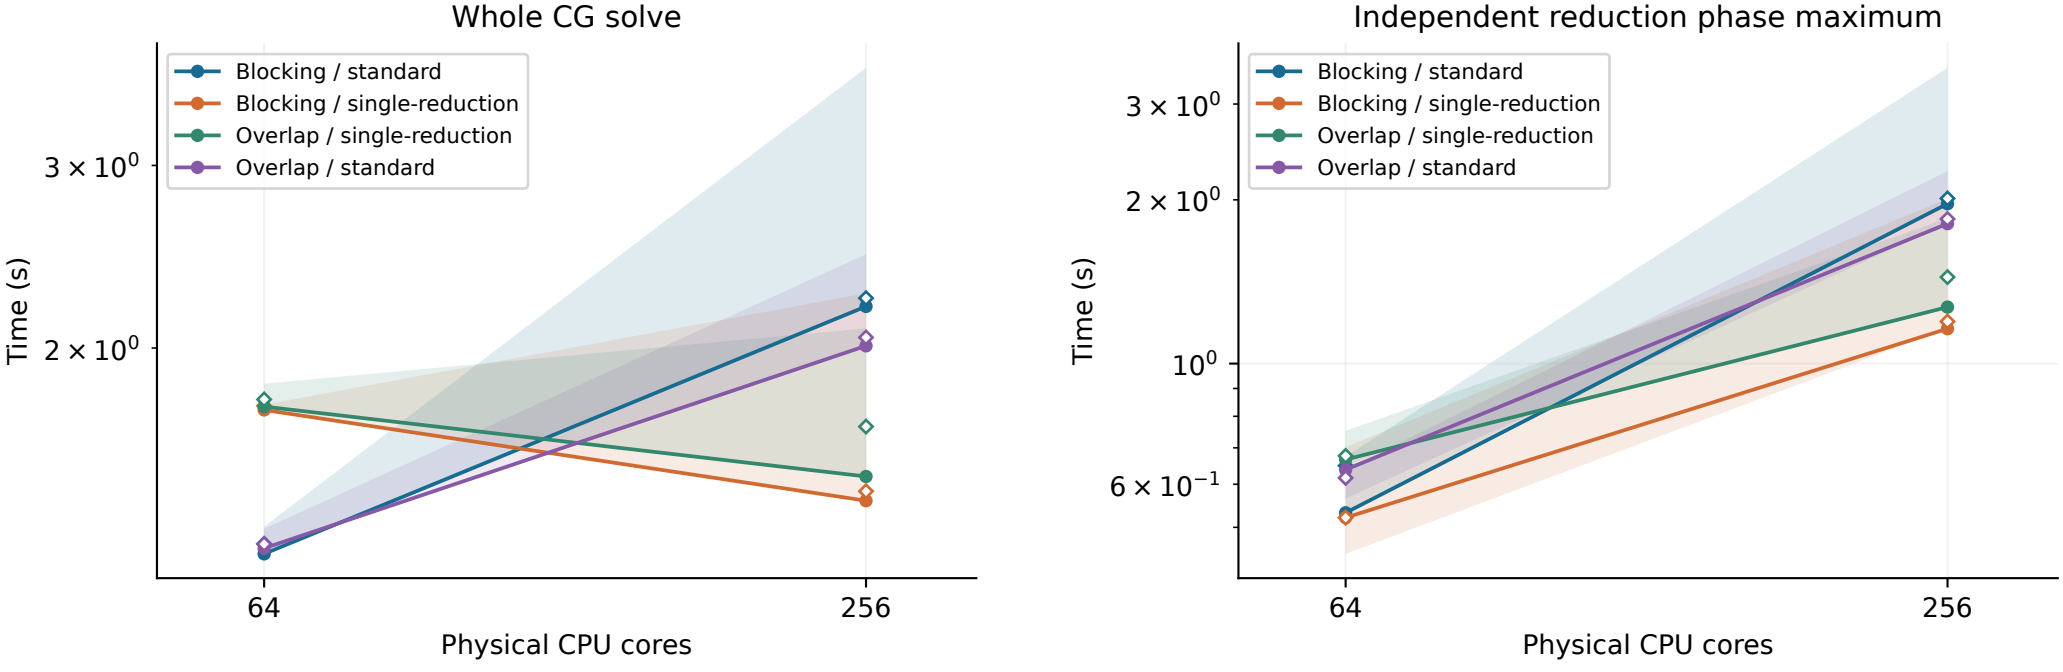

Line/filled marker: minimum; hollow diamond: median; shading: observed min-max (3 runs, not a CI).
3D curve ends at 216 cores; the planned 256-core point is absent and is not interpolated.
Whole-solve time includes iteration growth; per-iteration ratios isolate average iteration cost.

2D parallelization choices | n=2048 | Cartesian decomposition

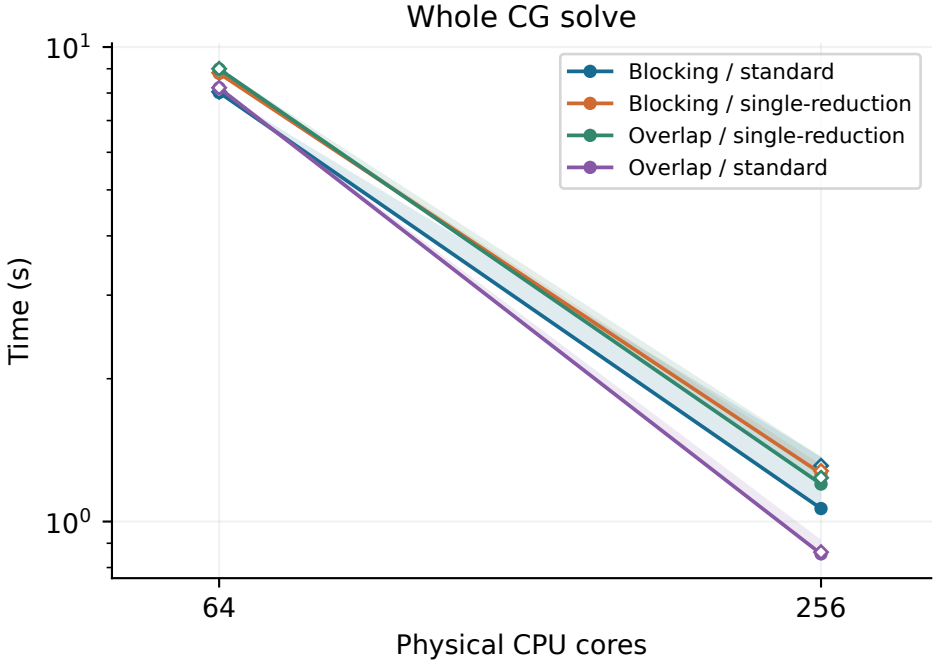

Vanda | audited CPU measurements | 3 independent runs per configuration

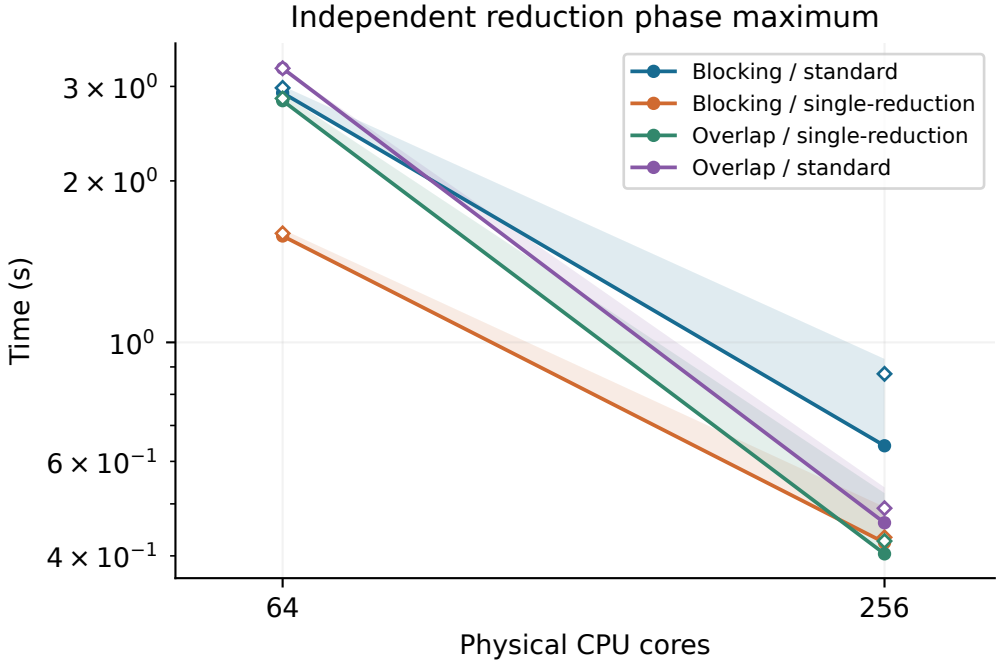

Whole solve: minimum/median/range of 3 runs. Phase line: same row as minimum solve; hollow: phase median.
'pipe' is single-reduction CG (Chronopoulos-Gear); it is not a claim of asynchronous pipelined CG.

3D parallelization choices | n=288 | Cartesian decomposition

Vanda | audited CPU measurements | 3 independent runs per configuration

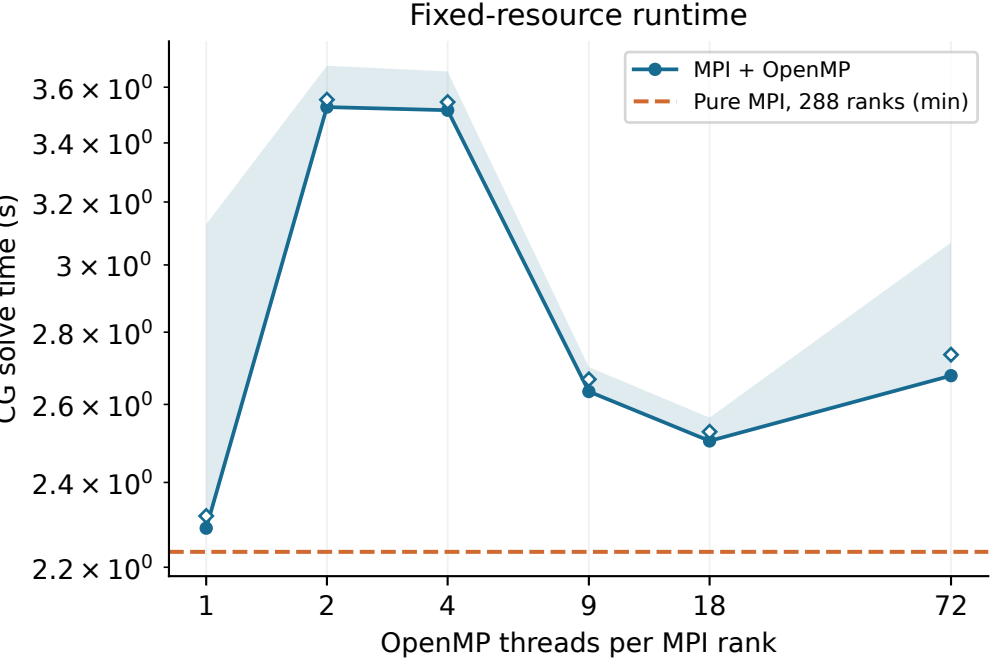

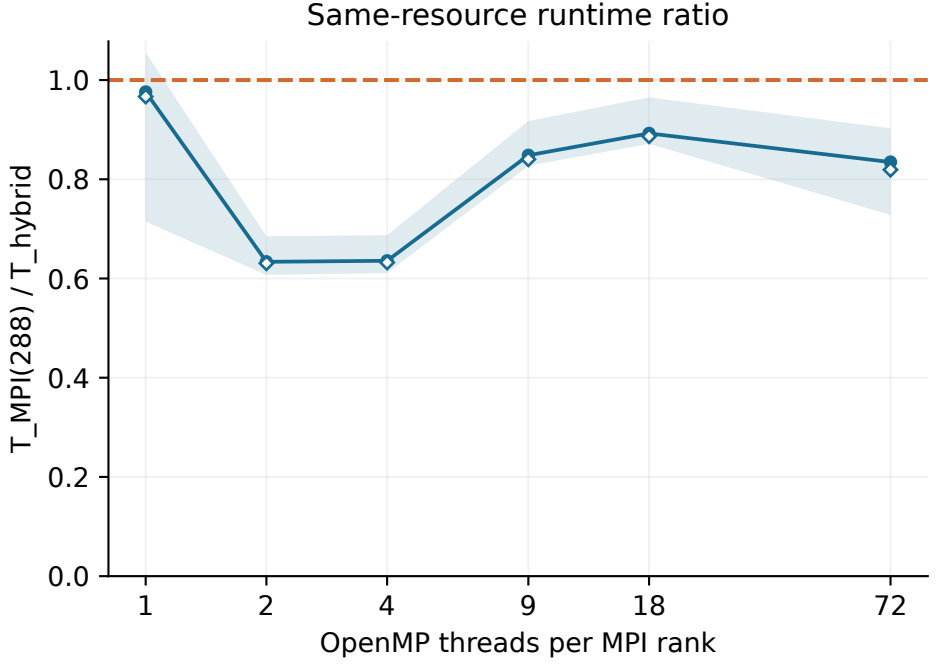

Whole solve: minimum/median/range of 3 runs. Phase line: same row as minimum solve; hollow: phase median.
'pipe' is single-reduction CG (Chronopoulos-Gear); it is not a claim of asynchronous pipelined CG.

2D MPI + OpenMP | n=2048 | fixed 288 physical cores

Vanda | audited CPU measurements | 3 independent runs per configuration

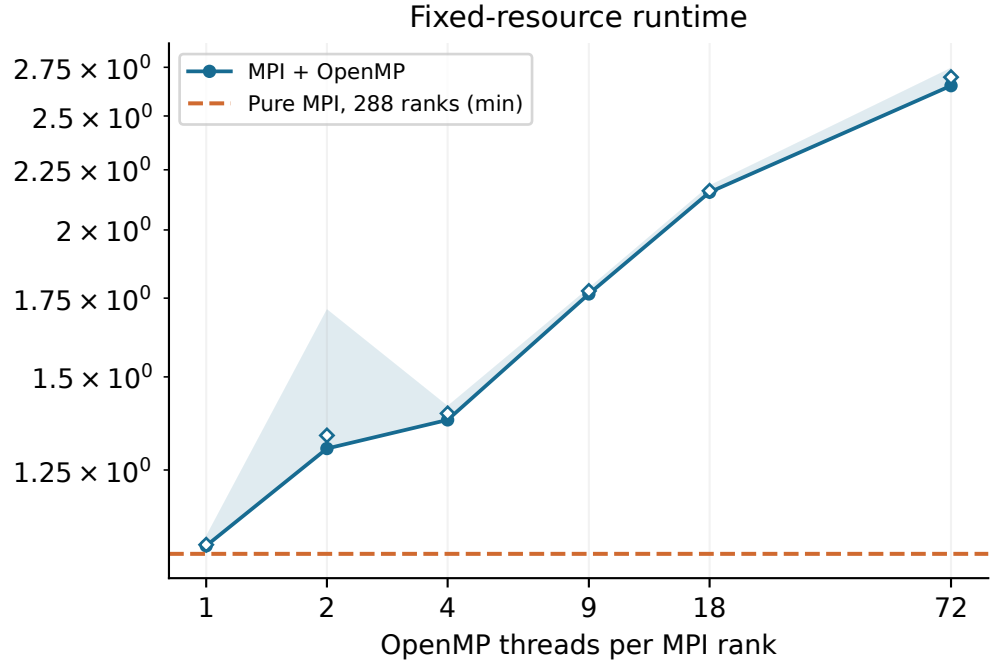

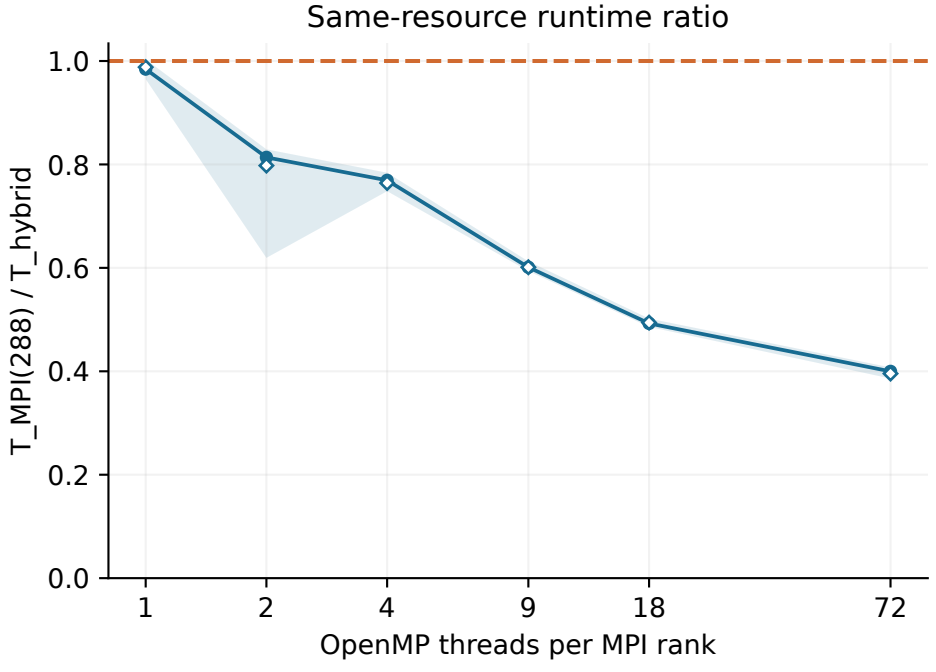

Line/filled marker: minimum; hollow diamond: median; shading: observed min-max (3 runs, not a CI).
MPI ranks x threads: 288x1, 144x2, 72x4, 32x9, 16x18, 4x72. Ratio is not a strong-scaling efficiency.

3D MPI + OpenMP | n=288 | fixed 288 physical cores

Vanda | audited CPU measurements | 3 independent runs per configuration

Line/filled marker: minimum; hollow diamond: median; shading: observed min-max (3 runs, not a CI).
MPI ranks x threads: 288x1, 144x2, 72x4, 32x9, 16x18, 4x72. Ratio is not a strong-scaling efficiency.
